

Disjoint vs. Independent

		Disjoint	
		Yes	No
		<p>If $P(A \cap B) = 0$ *Mutually Exclusive *No Overlap in Venn Diagram $P(A \cup B) = P(A) + P(B)$</p>	<p>If $P(A \cap B) \neq 0$ *Can Occur Together *Overlap in Venn Diagram $P(A \cup B) = P(A) + P(B) - P(A \cap B)$</p>
Independent	Yes	<p>If $P(B) = P(B A)$ *Knowing that A has occurred does NOT affect the probability that B occurs $P(A \cap B) = P(A)P(B)$</p>	<p>Impossible $P(A \cap B) = 0$ if disjoint, but $P(A)P(B) \neq 0$ because neither $P(A)$ nor $P(B) = 0$</p>
	No	<p>If $P(B) \neq P(B A)$ *Knowing that A has occurred DOES affect the probability that B occurs $P(A \cap B) = P(A)P(B A)$</p>	<p>Impossible $P(A \cap B) = 0$ Ex. $P(\text{Queen} \cap \text{King})$ when drawing ONE card</p>
		 <p>$P(A \cap B) = P(A)P(B)$ Ex. $P(\text{Queen} \cap \text{King})$ when drawing TWO cards WITH replacement</p>	 <p>$P(A \cap B) \neq P(A)P(B)$ Ex. $P(\text{Queen} \cap \text{King})$ when drawing TWO cards withOUT replacement</p>
